

# Designing & Building Taxonomies

Gary Carlson + Rachel Price  
IA Summit 2017

factor

Hi!

**Gary Carlson**

**Rachel Price**

Let's get cookin'.

**What happened?**

What is a taxonomy, anyway?

### Wednesday, March 22

7:30am

Registration Opens

8:30am

The Visual Display of Information (\$350)  
Stephen Anderson

Collaborative Information Architecture (\$350)  
Abby Covert

9:00am

Introduction to Information Architecture (\$650)  
Donna Spencer

Mapping the Domain: The 5th Academics' and Practitioners' Roundtable (\$200)  
Keith Instone • Bern Irizarry • Andrea Resmini • Sarah Rice • Stacy Surla

Deep Text: Using Text Analytics to Create New Ways to Structure and Access Information (\$650)  
Tom Reamy

Gathering evidence for  
design decisions

# A taxonomy project

# Inputs to taxonomy design

## Why so many inputs?

# Business Goals

**What it is:** Document the business drivers that are behind this taxonomy work.  
What are the business goals that the taxonomy needs to support?

**How it helps:** Gives you some direction about the higher level, overall goals of the taxonomy. What qualities does it need to surface?

## Sample Findings:

Show consumers that we provide high quality, lifetime kitchen products.  
Promote our new Chef's Star packages of product bundles.  
Deliver consistent information across all our touchpoints.

# Current Taxonomy Assessment

**What it is:** Review of the existing taxonomies to determine how they support the business goals, if they meet quality standard, and whether they are maintainable and implementable in the technology stack.

**How it helps:** Helps frame the scope of work going forward and often provides a tactical list of quick wins.

## Sample Findings:

Taxonomy has many duplicate or similar terms

Taxonomy does not reflect current marketing effort to sell sets of products

Taxonomy domain is poorly defined: what's in, and what's clearly out?

# User Research

**What it is:** Qualitative research of your users behaviors and information needs. Can take many forms - generative or evaluative.

**How it helps:** Gives you directional information about how people structure your catalog in their heads (relationships between concepts), provides direction on language and term labels.

## Sample Findings:

Users are interested in activities rather than individual products

Users feel alienated by industry jargon

Product names in the taxonomy are not familiar to the users

# Technology Assessment

**What it is:** documents the the technical capabilities of the organization with respect to taxonomy modeling, management, and integration

**How it helps:** Provides clear understanding of what the current technology can support. This makes it easier to design and build taxonomies that can be easily utilized. Where there are gaps, this can help drive a technology roadmap.

## Sample Findings:

The CMS can only support 3 levels of hierarchy in the navigation.

The CMS cannot export the hierarchy.

Search tool supports synonyms and associated terms.

# Governance Assessment

**What it is:** A review of the inputs, tasks, roles, and impacts of changes required to maintain the taxonomy so that it meets the needs of all stakeholders

**How it helps:** An understanding of the types of changes that will need to be supported and the approval processes. These can have large impacts on the taxonomy design and are essential for designing of the governance processes.

## Sample Findings:

Product managers and executive teams need a sales report that shows sales by major product category. They will also need to govern their own teams based on major product category.

HR team needs sets of taxonomy terms that are not visible and cannot be searched on by other groups in the organization.

**Identify requirements**

**What happened?**

**Break!**

**[5 minutes]**

What taxonomies do we  
need?

## Defining taxonomies

*Describing the taxonomy itself so that it can be implemented properly and used by others.*

*This should provide the information needed by both the technical teams and the business teams to move forward.*

# Defining taxonomies

1. **Domain:** what the taxonomy contains & what it excludes.

# Defining taxonomies

1. **Domain:** what the taxonomy contains & what it excludes.
2. **Usage Notes:** how should it be used?

# Defining taxonomies

1. **Domain:** what the taxonomy contains & what it excludes.
2. **Usage Notes:** how should it be used?
3. **Types of terms:** what kind of terms will I find here?

'Shape' facet disappears!

Search term level of specificity impacts result page

Wayfair.com

# Content Assessment

**What it is:** Documents the types of information being used and the different ways the information is bundled, distributed, and categorized

**How it helps:** Ultimately the taxonomies will need to support the different ways the information is used, so this is an essential input to the taxonomy design

## Sample Findings:

Product information does not include the intended use of the product

Editorial content does not link to product pages

Current product features are inconsistent across like products

Products are tagged inconsistently

# Analytics Assessment

**What it is:** Digging through any analytics data you have about the current taxonomy and user behavior around it.

**How it helps:** Great for answering specific questions that come up in other assessments. “I wonder what terms people use in our search tool? I wonder how people move through the navigation? I wonder what paths our users take most frequently?”

## Sample Findings:

Look at the search query logs provided to see if there are any themes or patterns to the search queries that people use on the site.

# Workflow Assessment

**What it is:** Often closely tied to the governance assessment, this documents the processes necessary to create, maintain, and use the taxonomy internally.

**How it helps:** Identifies the requirements of internal users of the taxonomy. Also documents the level of effort required to use the taxonomy. Each of these can impact the scope, design, and resourcing for the taxonomy.

## Sample Findings:

There is no systematic way to assign colors consistently to products and content editors must enter product colors by hand.

Knives need to undergo legal review.

# Legal Assessment

**What it is:** Checking with the legal team (if there is one) about compliance regulations and other red tape that may impact your decisions.

**How it helps:** Makes you aware of your legal constraints - compliance regulations, trademark or copyright issues for term names, contractual issues to be addressed, etc.

## Sample Findings:

When you get to talking about governance, you need to give the legal team an advisory role when terms are being changed.
